

# Search in Rotated Sorted Array - Notes

What is a Rotated Sorted Array?

- A sorted array is rotated by shifting some elements from the beginning to the end.
- Example:  
Sorted: [0, 1, 2, 3, 4, 5]  
Rotated: [3, 4, 5, 0, 1, 2]
- We must search for a target element in this rotated array using binary search logic.

Goal

Find the index of the target value in the array in  $O(\log n)$  time.

Concept and Logic Behind the Algorithm

## 1. Binary Search Basics

- Normally, binary search works on a sorted array.
- We keep checking the middle element and reduce the search range accordingly.

## 2. New Challenge: Rotation

- In a rotated array, the whole array isn't sorted, but one half is always sorted.
- So, instead of checking if the whole array is sorted, we check which half is sorted.

Step-by-Step Logic

Step 1: Start Binary Search

- Set two pointers: start at the beginning and end at the last index.

Step 2: Find Middle

- Use the formula:  $mid = start + (end - start) / 2$

Step 3: Compare with Target

- If  $arr[mid] == target$ : You found the element return mid

Main Strategy: Decide Which Half to Search

A. Check if Left Half is Sorted

## Search in Rotated Sorted Array - Notes

If  $\text{arr}[\text{start}] \leq \text{arr}[\text{mid}]$ :

Left half is sorted

Then check:

If target lies between  $\text{arr}[\text{start}]$  and  $\text{arr}[\text{mid}]$ :

Search in left half  $\text{end} = \text{mid} - 1$

Else:

Search in right half  $\text{start} = \text{mid} + 1$

B. Otherwise, Right Half is Sorted

If  $\text{arr}[\text{mid}] \leq \text{arr}[\text{end}]$ :

Right half is sorted

Then check:

If target lies between  $\text{arr}[\text{mid}]$  and  $\text{arr}[\text{end}]$ :

Search in right half  $\text{start} = \text{mid} + 1$

Else:

Search in left half  $\text{end} = \text{mid} - 1$

Step 4: Repeat

- Continue the process until the element is found or  $\text{start} > \text{end}$ .

Important Conditions Summary

Condition	Meaning	Action
----- ----- -----		
$\text{arr}[\text{start}] \leq \text{arr}[\text{mid}]$	Left half is sorted	Check if target is in it
$\text{arr}[\text{mid}] \leq \text{arr}[\text{end}]$	Right half is sorted	Check if target is in it
$\text{arr}[\text{mid}] == \text{target}$	Target found	Return mid

Final Notes

- Always identify which half is sorted before deciding where to search.
- In every iteration of the loop: one half is guaranteed to be sorted.
- Hence, the search works in  $O(\log n)$  time.
